"Inmaculada de Melo-Martin carefully defend the importance of social and political policies to guide the bio ethical co-construction of a better life for all. As she argues with edifying balance, only by taking biology seriously can we become serious in appreciating its true benefits and counter the illusory hopes and fears that are often projected upon it."--Carl Mitcham, Colorado School of Mines.

This major new series in the philosophy of science aims to provide a new generation of textbooks for the subject. The series will not only offer fresh treatments of core topics in the theory and methodology of scientific knowledge, but also introductions to newer areas of the discipline. Furthermore, the series will cover topics in current science that raise significant foundational issues both for scientific theory and for philosophy more generally. Biology raises distinct questions of its own not only for philosophy of science, but for

metaphysics, epistemology and ethics. This comprehensive new textbook for a rapidly growing field of study provides students new to the subject with an up-to-date presentation of the key philosophical issues. Care is taken throughout to keep the technicalities accessible to the non-biologist but without sacrificing the philosophical subtleties. The first part of the book covers the philosophical challenges posed by evolution and evolutionary biology, beginning with Darwin's central argument in the Origin of the Species. Individual chapters cover natural selection, the selfish gene, alternative units of selection, developmental systems theory, adaptionism and issues in macroevolution. The second part of the book examines philosophical questions arising in connection with biological traits, function, nature and nurture, and biological kinds. The third part of the book examines metaphysical questions, biology's relation with the traditional concerns of philosophy of science, and how evolution has been introduced into epistemological debates. The final part considers the relevance of biology to questions about ethics, religion and human nature.

University Education in Computing Science documents the proceedings of a conference on graduate academic and related research programs in computing science, held at the State University of New York at Stony Brook on June 8, 1967. This book provides a comprehensive study of the role of the computing sciences as an academic program, including its organizational structure and relationship to the computing center. The undergraduate education in computing science and operational policies of university computing centers are also elaborated. Other topics include the graduate computer science program at American universities, dilemma of computer sciences, and science and engineering of information. The industry's view of computing science and doctoral program in computing science are likewise covered. This publication is suitable for educational, industrial, and governmental organizations concerned with education related to

Written and edited by experts in the field, this book brings together the current state of the art in phenotypic and rational, target-based approaches to drug discovery against pathogenic protozoa. The chapters focus particularly on virtual compounds and high throughput screening, natural products, computer-assisted drug design, structure-based drug design, mechanism of action identification, and pathway modelling. Furthermore, state-of the art "omics" technologies are described and currently studied enzymatic drug targets are discussed. Mathematical, systems biology-based approaches are introduced as new methodologies for dissecting complex aspects of pathogen survival mechanisms and for target identification. In addition, recently developed anti-parasitic agents targeting particular pathways, which serve as lead compounds for further drug development, are presented.

Stamos squarely confronts the problem of determining what a biological species is, whether species are real, and the nature of their reality. He critically considers the evolution of the major contemporary views of species and also offers his own solution to the species problem.

Underlying the anthropological study of humans is the principle that there is a reality to which a human must adapt for survival. Populations must adapt to the realities of the physical world and maintain a proper fit between their biological makeup and the pressures of the various niches of the world. Social groups must develop adaptive mechanisms in the organization of their social relations if there is to be order, regularity, and predictability in patterns of cooperation and competition. This book presents an introduction to anthropology that is unified and made systematic by its focus on adaptations that have accompanied the evolution of humans, from non-human primates to inhabitants of vast urban

areas in modern industrial societies. Human Adaptation contains over forty outstanding essays that are intended to serve as an introduction to physical anthropology, archeology, and linguistics from the point of view of the processes of adaptation. The organization of these selections contains a balance between biological and prehistoric cultural adaptations. They provide coherence for the study of human evolution. Several selections, notably those in connection with linguistic adaptations, deal with contemporary people in order to shed light on earlier evolutionary processes. More than half of the selections deal with biological evolution. This volume unifies the subject matter of anthropology within a single and powerful explanatory framework and incorporates the work of the most renowned anthropological experts on man.

The first international anthology to document a radically new poetry which takes language beyond the confines of the printed page into a non-linear world of digital interactivity and hyperlinkage. The work of the poets discussed in this book challenges even the innovations of experimental poetics. It embraces new technologies to explore a new syntax made of linear and non-linear animation, hyperlinkage, interactivity, real-time text generation, spatiotemporal discontinuities, self-similarity, synthetic spaces, immateriality, diagrammatic relations, visual tempo, multiple simultaneities, and many other innovative procedures. This new media poetry, although defined within the field of experimental poetics, departs radically from the avant-garde movements of the first half of the century, and the print-based approaches of the second half. Through an embrace of the vast possibilities made available through new media, the artists in this anthology have become the poetic pioneers for the next millennium.

Biology is a source of fascination for most scientists, whether their training is in the life sciences or not. In particular, there is a special

satisfaction in discovering an understanding of biology in the context of another science like mathematics. Fortunately there are plenty of interesting (and fun) problems in biology, and virtually all scientific disciplines have become the richer for it. For example, two major journals, *Mathematical Biosciences* and *Journal of Mathematical Biology*, have tripled in size since their inceptions 20-25 years ago. The various sciences have a great deal to give to one another, but there are still too many fences separating them. In writing this book we have adopted the philosophy that mathematical biology is not merely the intrusion of one science into another, but has a unity of its own, in which both the biology and the mathematics should be equal and complete, and should flow smoothly into and out of one another. We have taught mathematical biology with this philosophy in mind and have seen profound changes in the outlooks of our science and engineering students: The attitude of "Oh no, another pendulum on a spring problem!," or "Yet one more LCD circuit!" completely disappeared in the face of applications of mathematics in biology. There is a timeliness in calculating a protocol for administering a drug.

This book uses fundamental ideas in dynamical systems to answer questions of a biologic nature, in particular, questions about the behavior of populations given a relatively few hypotheses about the nature of their growth and interaction. The principal subject treated is that of coexistence under certain parameter ranges, while asymptotic methods are used to show competitive exclusion in other parameter ranges. Finally, some problems in genetics are posed and analyzed as problems in nonlinear ordinary differential equations.
