General Cytochemical Methods, Volume II focuses on methods and techniques employed in the studies of the biochemistry of cells. Composed of eight chapters, the book looks at immersion refractometry of living cells by phase contrast and interference microscopy. Areas considered include interpretation of refractive index measurements as indicator of hydration; immersion refractometry with phase-contrast microscopy; and practical aspects of checking phase-change with interference microscopes. The text continues with the discussions on the Cartesian diver balance method. Particularly noted are the standards, principle, applications, and precision of the method, which has been proven effective in microgasometric measurements. The book also focuses on quantitative determination through a special "ampulla-diver" of the cholinesterase activity in cells. Given attention are the materials, methods, and results of experiments. The text also looks at periodate oxidation techniques; acylation and diazonium coupling in protein cytochemistry with special reference to the benzylation-tetrazonium method; and the use of dinitrobenzene as a cytochemical reagent. The book is a great find for readers interested in studying the biochemistry of cells.
